DRIVING AMBITIOUS CORPORATE CLIMATE ACTION

THE SBTI VALIDATES THE DECARBONIZATION TARGETS OF THE ALTAIR GROUP

The Science Based Targets (SBTi) initiative has just approved the Altair Group's greenhouse gas emission reduction targets.

The IPCC reports are clear: it is now urgent to act, each at our own level and in a coordinated mode, to curb global warming. It was with this in mind that the Altair group carried out its carbon footprint in 2022. This assessment enabled our teams to identify the main emission sources linked to their activities, and to set decarbonization targets.

In order to set relevant reduction targets, in line with the scientific work of the IPCC and the objectives of the Paris Agreements, Altair decided to work with the Science Based Targets initiative. This collective was created in 2015 by the Carbon Disclosure Project (CDP), the World Resource Institute (WRI), WWF and the United Nations Global Compact.

By 2030, the Altair Group is committed to the following objectives:

-42%
**greenhouse
gas emissions**
on scope 1 and 2

-25%
**greenhouse
gas emissions**
on scope 3

The reduction targets have been broken down into trajectories and action plans for all activities, and in particular for the three sources that emit the most CO₂: energy, freight and eco-design.

"In 2023, we reached a new milestone. We signed up to the Science Based Target initiative (SBTi) and had our CO₂ emission reduction targets validated by climate experts. This initiative guides us in our efforts to contribute to the global effort to combat climate change, and to stay within the targets set out in the Paris Agreement, i.e. a maximum warming of 1.5°C. Our targets are very ambitious, and we will do everything in our power to achieve them. Together with the management team, I am committed to doing everything possible to ensure that, from 2024 onwards, we no longer simply say we want to get there, but that we say with conviction we're going to get there!"

Etienne SACILOTTO, CEO of the Altair Group

ABOUT ALTAIR

Through its flagship brands (Starwax, Briochin, Oro...), Altair offers a complete range of cleaning, renovation and protection products for the whole home. The Group is present in 45 countries and employs 480 people at 4 production sites: 3 in France and 1 in Spain. In 2022, it generated sales of 165 million euros.

Scopes are a classification used to assess greenhouse gas (GHG) emissions as part of a carbon footprint. (1) SCOPE 1: Direct emissions from production activities. (2) SCOPE 2: Indirect emissions linked to energy consumption. (3) SCOPE 3: Indirect emissions not related to production (supply, transport, use, end-of-life, etc.).
